

Solution Brief

Insight's NIS2 Awareness Workshop

Are you fully aware of the new directive for Network Information Security (NIS2)?

Background

The new directive NIS2 will come into force on 18th October 2024, designed to improve the resilience and security of the network and information systems within the EU. It has expanded the breadth and depth of the original directive with more comprehensive security controls, rigorous incident reporting requirements and increased enforcement measures with sanctions. The list of sectors in scope has increased and there is a distinction made between essential and important sectors.

If your organisation is now in scope, it is important for your senior leaders to understand the impacts, requirements and obligations of NIS2.

How Insight can help

Insight can help prepare your senior management team by raising the awareness and importance of the enhanced security requirements. NIS2 takes a more proactive approach to compliance, emphasising risk management and incident reporting.

How we engage and deliver:

- Discovery interviews (2hrs): to understand organisational structure, culture and main goals.
- Workshop (4hrs): tailored content based on discover interviews, covering an explanation of NIS2, current state of the implementation period and possible next steps.
- Documentation: presentation content of workshop, answers to any outstanding questions raised.

Your senior management team will be equipped with the right information as it relates to their business and current situation, with the possible next steps required to comply with NIS2 by October 2024.

Next Steps

Once you have completed the NIS2 Awareness Workshop the next step could be a NIS2 Assessment. Insight's NIS2 Assessment covers a wide range of areas, including policies, procedures, technical controls, and organisational culture. The assessment report includes an analysis of the organisation's cybersecurity posture, a summary of identified gaps, and recommendations for remediation to help you strategise and prioritise your compliance efforts.

Important to understand

NIS2 stands for the Network and Information Systems Directive 2, an EU directive that updates and expands the cybersecurity and reporting requirements established by the original NIS Directive.

It aims to enhance national and EU-level cybersecurity capabilities, increase the resilience of network and information systems, and foster a high level of cybersecurity risk management across various sectors.

It mandates robust security measures, including risk management practices, incident handling, supply chain security, and vulnerability disclosures.

It also applies to organisations outside of the EU who deliver services into the EU.
